Package 'Cyclops'

June 22, 2015

```
Title Cyclic Coordinate Descent for Logistic, Poisson and Survival Analysis
Version 1.1.0
Author Marc A. Suchard [aut, cre],
      Martijn J. Schuemie [aut],
      Trevor R. Shaddox [aut]
Maintainer Marc A. Suchard <msuchard@ucla.edu>
Description This model fitting tool incorporates cyclic coordinate descent and
      majorization-minimization approaches to fit a variety of regression models
      found in large-scale observational healthcare data. Implementations focus
      on computational optimization and fine-scale parallelization to yield
      efficient inference in massive datasets.

coef.cyclopsFit

Extract model coefficients

Description

coef.cyclopsFit extracts model coefficients from an Cyclops model fit object

Usage

Index

```
## S3 method for class cyclopsFit
coef(object, ...)
```

Arguments

object Cyclops model fit object

... Other arguments

confint.cyclopsFit 3

Value

Named numeric vector of model coefficients.

confint.cyclopsFit Confidence intervals for Cyclops model parameters

Description

confinit.cyclopsFit profiles the data likelihood to construct confidence intervals of arbitrary level. Usually it only makes sense to do this for variables that have not been regularized TODO: Profile data likelihood or joint distribution of remaining parameters.

Usage

```
## S3 method for class cyclopsFit
confint(object, parm, level = 0.95,
   overrideNoRegularization = FALSE, includePenalty = TRUE, ...)
```

Arguments

object A fitted Cyclops model object

parm A specification of which parameters require confidence intervals, either a vector

of numbers of covariateId names

level Numeric: confidence level required

over ride No Regularization

Logical: Enable confidence interval estimation for regularized parameters

includePenalty Logical: Include regularized covariate penalty in profile

. . . Additional argument(s) for methods

Value

A matrix with columns reporting lower and upper confidence limits for each parameter. These columns are labelled as (1-level) / 2 and 1 - (1 - level) / 2 in percent (by default 2.5 percent and 97.5 percent)

```
#Find out what the optimal hyperparameter was:
getHyperParameter(fit)

#Extract the current log-likelihood, and coefficients
logLik(fit)
coef(fit)

#We can only retrieve the confidence interval for unregularized coefficients:
confint(fit, c(0))
```

 ${\it convert ToCyclopsData} \quad {\it Convert data from two data frames or ffdf objects into a CyclopsData} \\ {\it object}$

Description

convertToCyclopsData loads data from two data frames or ffdf objects, and inserts it into a Cyclops data object.

Usage

```
convertToCyclopsData(outcomes, covariates, modelType = "lr",
   addIntercept = TRUE, checkSorting = TRUE, checkRowIds = TRUE,
   quiet = FALSE)

## S3 method for class ffdf
convertToCyclopsData(outcomes, covariates, modelType = "lr",
   addIntercept = TRUE, checkSorting = TRUE, checkRowIds = TRUE,
   quiet = FALSE)

## S3 method for class data.frame
convertToCyclopsData(outcomes, covariates,
   modelType = "lr", addIntercept = TRUE, checkSorting = TRUE,
   checkRowIds = TRUE, quiet = FALSE)
```

Arguments

outcomes	A data frame or ffdf object containing the outcomes with predefined columns (see below).
covariates	A data frame or ffdf object containing the covariates with predefined columns (see below).
modelType	Cyclops model type. Current supported types are "pr", "cpr", lr", "clr", or "cox"
addIntercept	Add an intercept to the model?
checkSorting	Check if the data are sorted appropriately, and if not, sort.
checkRowIds	Check if all rowlds in the covariates appear in the outcomes.
quiet	If true, (warning) messages are surpressed.

Details

These columns are expected in the outcome object:

convertToCyclopsData 5

stratumId	(integer)	(optional) Stratum ID for conditional regression models
rowId	(integer)	Row ID is used to link multiple covariates (x) to a single outcome (y)
у	(real)	The outcome variable
time	(real)	For models that use time (e.g. Poisson or Cox regression) this contains time
		(e.g. number of days)

These columns are expected in the covariates object:

stratumId	(integer)	(optional) Stratum ID for conditional regression models
rowId	(integer)	Row ID is used to link multiple covariates (x) to a single outcome (y)
covariateId	(integer)	A numeric identifier of a covariate
covariateValue	(real)	The value of the specified covariate

Note: If checkSorting is turned off, the outcome table should be sorted by stratumId (if present) and then rowId except for Cox regression when the table should be sorted by stratumId (if present), - time, y, and rowId. The covariate table should be sorted by covariateId, stratumId (if present), rowId except for Cox regression when the table should be sorted by covariateId, stratumId (if present), - time, y, and rowId.

Value

An object of type cyclopsData

Methods (by class)

- ffdf: Convert data from two ffdf
- data.frame: Convert data from two data.frame

6 createControl

Description

coverage computes the coverage on confidence intervals

Usage

```
coverage(goldStandard, lowerBounds, upperBounds)
```

Arguments

goldStandard Numeric vector

lowerBounds Numeric vector. Lower bound of the confidence intervals

upperBounds Numeric vector. Upper bound of the confidence intervals

Value

The proportion of times goldStandard falls between lowerBound and upperBound

createControl	Create a Cyclops control object	

Description

createControl creates a Cyclops control object for use with fitCyclopsModel.

Usage

```
createControl(maxIterations = 1000, tolerance = 1e-06,
  convergenceType = "gradient", cvType = "grid", fold = 10,
  lowerLimit = 0.01, upperLimit = 20, gridSteps = 10, cvRepetitions = 1,
  minCVData = 100, noiseLevel = "silent", threads = 1, seed = NULL,
  resetCoefficients = FALSE, startingVariance = -1, useKKTSwindle = FALSE,
  tuneSwindle = 10, selectorType = "default")
```

Arguments

maxIterations Integer: maximum iterations of Cyclops to attempt before returning a failed-toconverge error

tolerance Numeric: maximum relative change in convergence criterion from successive iterations to achieve convergence

convergenceType

String: name of convergence criterion to employ (described in more detail below)

cvType String: name of cross validation search. Option "auto" selects an auto-search following BBR. Option "grid" selects a grid-search cross validation

createControl 7

fold Numeric: Number of random folds to employ in cross validation

lowerLimit Numeric: Lower prior variance limit for grid-search upperLimit Numeric: Upper prior variance limit for grid-search

gridSteps Numeric: Number of steps in grid-search

cvRepetitions Numeric: Number of repetitions of X-fold cross validation minCVData Numeric: Minumim number of data for cross validation

noiseLevel String: level of Cyclops screen output ("silent", "quiet", "noisy")

threads Numeric: Specify number of CPU threads to employ in cross-validation; default

= 1 (auto = -1)

seed Numeric: Specify random number generator seed. A null value sets seed via

Sys.time.

resetCoefficients

Logical: Reset all coefficients to 0 between model fits under cross-validation

startingVariance

Numeric: Starting variance for auto-search cross-validation; default = -1 (use

estimate based on data)

useKKTSwindle Logical: Use the Karush-Kuhn-Tucker conditions to limit search

tuneSwindle Numeric: Size multiplier for active set

selectorType String: name of exchangeable sampling unit. If missing, then default for model

is used. Option "byPid" selects entire strata. Option "byRow" selects single

rows

Todo: Describe convegence types

Value

A Cyclops control object of class inheriting from "cyclopsControl" for use with fitCyclopsModel.

```
#Generate some simulated data:
sim <- simulateCyclopsData(nstrata = 1, nrows = 1000, ncovars = 2, eCovarsPerRow = 0.5,</pre>
                            model = "poisson")
cyclopsData <- convertToCyclopsData(sim$outcomes, sim$covariates, modelType = "pr",</pre>
                                      addIntercept = TRUE)
#Define the prior and control objects to use cross-validation for finding the
#optimal hyperparameter:
prior <- createPrior("laplace", exclude = 0, useCrossValidation = TRUE)</pre>
control <- createControl(cvType = "auto", noiseLevel = "quiet")</pre>
fit <- fitCyclopsModel(cyclopsData,prior = prior, control = control)</pre>
#Find out what the optimal hyperparameter was:
getHyperParameter(fit)
#Extract the current log-likelihood, and coefficients
logLik(fit)
coef(fit)
#We can only retrieve the confidence interval for unregularized coefficients:
confint(fit, c(0))
```

8 createCyclopsData

|--|

Description

createCyclopsData creates a Cyclops data object from an R formula or data matrices.

Usage

```
createCyclopsData(formula, sparseFormula, indicatorFormula, modelType, data,
  subset, weights, offset, time = NULL, pid = NULL, y = NULL,
  type = NULL, dx = NULL, sx = NULL, ix = NULL, model = FALSE,
  method = "cyclops.fit")
```

Arguments

formula	An object of class	"formula" that	nrovides a si	vmholic descri	ntion of the nu-
TOTIIIUIA	All object of class	TOT IIIUI a tilat	provides a s	ymbone desem	phon of the nu-

merically dense model response and terms.

sparseFormula An object of class "formula" that provides a symbolic description of numeri-

cally sparse model terms.

indicatorFormula

An object of class "formula" that provides a symbolic description of {0,1}

model terms.

modelType character string: Valid types are listed below.

data An optional data frame, list or environment containing the variables in the model.

subset Currently unused weights Currently unused offset Currently unused

time Currently undocumented

Optional vector of integer stratum identifiers. If supplied, all rows must be sorted

by increasing identifiers

y Currently undocumented type Currently undocumented

dx Optional dense "Matrix" of covariates sx Optional sparse "Matrix" of covariates ix Optional {0,1} "Matrix" of covariates

model Currently undocumented method Currently undocumented

Details

This function creates a Cyclops model data object from R "formula" or directly from numeric vectors and matrices to define the model response and covariates. If specifying a model using a "formula", then the left-hand side define the model response and the right-hand side defines dense covariate terms. Objects provided with "sparseFormula" and "indicatorFormula" must be include left-hand side responses and terms are coersed into sparse and indicator representations for computational efficiency.

Items to discuss: * Only use formula or (y,dx,...) * stratum() in formula * offset() in formula * when "stratum" (renamed from pid) are necessary * when "time" are necessary

createPrior 9

Value

A list that contains a Cyclops model data object pointer and an operation duration

Models

Currently supported model types are:

"ls" Least squares

"pr" Poisson regression

"lr" Logistic regression

"clr" Conditional logistic regression

"cpr" Conditional Poisson regression

"sccs" Self-controlled case series

"cox" Cox proportional hazards regression

Examples

createPrior

Create a Cyclops prior object

Description

createPrior creates a Cyclops prior object for use with fitCyclopsModel.

Usage

```
createPrior(priorType, variance = 1, exclude = c(), graph = NULL,
  useCrossValidation = FALSE, forceIntercept = FALSE)
```

Arguments

priorType Character: specifies prior distribution. See below for options
variance Numeric: prior distribution variance
exclude A vector of numbers or covariateId names to exclude from prior

10 cyclops

```
graph Child-to-parent mapping for a hierarchical prior
useCrossValidation
Logical: Perform cross-validation to determine prior variance.
forceIntercept Logical: Force intercept coefficient into prior
```

Value

A Cyclops prior object of class inheriting from "cyclopsPrior" for use with fitCyclopsModel.

Prior types

We specify all priors in terms of their variance parameters. Similar fitting tools for regularized regression often parameterize the Laplace distribution in terms of a rate "lambda" per observation. See "glmnet", for example.

```
variance = 2 * / (nobs * lambda)^2 or lambda = sqrt(2 / variance) / nobs
```

Examples

```
#Generate some simulated data:
sim <- simulateCyclopsData(nstrata = 1, nrows = 1000, ncovars = 2, eCovarsPerRow = 0.5,</pre>
                            model = "poisson")
cyclopsData <- convertToCyclopsData(sim$outcomes, sim$covariates, modelType = "pr",</pre>
                                     addIntercept = TRUE)
#Define the prior and control objects to use cross-validation for finding the
#optimal hyperparameter:
prior <- createPrior("laplace", exclude = 0, useCrossValidation = TRUE)</pre>
control <- createControl(cvType = "auto", noiseLevel = "quiet")</pre>
fit <- fitCyclopsModel(cyclopsData,prior = prior, control = control)</pre>
#Find out what the optimal hyperparameter was:
getHyperParameter(fit)
#Extract the current log-likelihood, and coefficients
logLik(fit)
coef(fit)
#We can only retrieve the confidence interval for unregularized coefficients:
confint(fit, c(0))
```

cyclops

Cyclops: Cyclic coordinate descent for logistic, Poisson and survival analysis

Description

The Cyclops package incorporates cyclic coordinate descent and majorization-minimization approaches to fit a variety of regression models found in large-scale observational healthcare data. Implementations focus on computational optimization and fine-scale parallelization to yield efficient inference in massive datasets.

fitCyclopsModel 11

fitCyclopsModel Fit a Cyclops model

Description

fitCyclopsModel fits a Cyclops model data object

Usage

```
fitCyclopsModel(cyclopsData, prior, control, weights = NULL,
  forceNewObject = FALSE, returnEstimates = TRUE,
  startingCoefficients = NULL)
```

Arguments

cyclopsData A Cyclops data object

prior A prior object. More details are given below.

control Cyclops control object, see "control" weights Vector of 0/1 weights for each data row

forceNewObject Logical, forces the construction of a new Cyclops model fit object

returnEstimates

Logical, return regression coefficient estimates in Cyclops model fit object

startingCoefficients

Vector of starting values for optimization

Details

This function performs numerical optimization to fit a Cyclops model data object.

Value

A list that contains a Cyclops model fit object pointer and an operation duration

Prior

Currently supported prior types are:

```
"none" Useful for finding MLE
"laplace" L_1 regularization
"normal" L_2 regularization
```

fitCyclopsSimulation Fit simulated data

Description

fitCyclopsSimulation fits simulated Cyclops data using Cyclops or a standard routine. This function is useful for simulation studies comparing the performance of Cyclops when considering large, sparse datasets.

Usage

```
fitCyclopsSimulation(sim, useCyclops = TRUE, model = "logistic",
  coverage = TRUE, includePenalty = FALSE)
```

Arguments

sim A simulated Cyclops dataset generated via simulateCyclopsData

useCyclops Logical: use Cyclops or a standard routine
model String: Fitted regression model type
coverage Logical: report coverage statistics

includePenalty Logical: include regularized regression penalty in computing profile likelihood

based confidence intervals

getCovariateIds Get covariate identifiers

Description

getCovariateIds returns a vector of integer covariate identifiers in a Cyclops data object

Usage

```
getCovariateIds(object)
```

Arguments

object A Cyclops data object

getCovariateTypes 13

getCovariateTypes

Get covariate types

Description

getCovariateTypes returns a vector covariate types in a Cyclops data object

Usage

```
getCovariateTypes(object, covariateLabel)
```

Arguments

```
object A Cyclops data object covariateLabel Integer vector: covariate identifiers to return
```

getHyperParameter

Get hyperparameter

Description

getHyperParameter returns the current hyper parameter in a Cyclops model fit object

Usage

```
getHyperParameter(object)
```

Arguments

object

A Cyclops model fit object

14 getNumberOfStrata

```
logLik(fit)
coef(fit)
```

 $\#We\ can\ only\ retrieve\ the\ confidence\ interval\ for\ unregularized\ coefficients:\ confint(fit,\ c(0))$

 ${\tt getNumberOfCovariates} \quad \textit{Get total number of covariates}$

Description

getNumberOfCovariates returns the total number of covariates in a Cyclops data object

Usage

getNumberOfCovariates(object)

Arguments

object

A Cyclops data object

 ${\tt getNumberOfRows}$

Get total number of rows

Description

getNumberOfRows returns the total number of outcome rows in a Cyclops data object

Usage

getNumberOfRows(object)

Arguments

object

A Cyclops data object

getNumberOfStrata

Get number of strata

Description

getNumberOfStrata return the number of unique strata in a Cyclops data object

Usage

getNumberOfStrata(object)

Arguments

object

A Cyclops data object

isInitialized 15

isInitialized

Check if a Cyclops data object is initialized

Description

isInitialized determines if an Cyclops data object is properly initialized and remains in memory. Cyclops data objects do not serialized/deserialize their back-end memory across R sessions.

Usage

```
isInitialized(object)
```

Arguments

object

Cyclops data object to test

isSorted

Check if data are sorted by one or more columns

Description

isSorted checks wether data are sorted by one or more specified columns.

Usage

```
isSorted(data, columnNames, ascending = rep(TRUE, length(columnNames)))
## S3 method for class data.frame
isSorted(data, columnNames, ascending = rep(TRUE,
    length(columnNames)))
## S3 method for class ffdf
isSorted(data, columnNames, ascending = rep(TRUE,
    length(columnNames)))
```

Arguments

data Either a data.frame of ffdf object.
columnNames Vector of one or more column names.

ascending Logical vector indicating the data should be sorted ascending or descending

according the specified columns.

Details

This function currently only supports checking for sorting on numeric values.

Value

True or false

16 logLik.cyclopsFit

Methods (by class)

- data.frame: Check if a data.frame is sorted by one or more columns
- ffdf: Check if a ffdf is sorted by one or more columns

Examples

```
x <- data.frame(a = runif(1000), b = runif(1000))
x <- round(x, digits=2)
isSorted(x, c("a", "b"))

x <- x[order(x$a, x$b),]
isSorted(x, c("a", "b"))

x <- x[order(x$a,-x$b),]
isSorted(x, c("a", "b"), c(TRUE, FALSE))</pre>
```

logLik.cyclopsFit

Extract log-likelihood

Description

logLik returns the current log-likelihood of the fit in a Cyclops model fit object

Usage

```
## S3 method for class cyclopsFit
logLik(object, ...)
```

Arguments

```
object A Cyclops model fit object
... Additional arguments
```

mse 17

```
\label{eq:coef} \begin{array}{l} logLik(fit)\\ coef(fit) \end{array} 
 #We can only retrieve the confidence interval for unregularized coefficients: confint(fit, c(0))
```

mse

Mean squared error

Description

mse computes the mean squared error between two numeric vectors

Usage

```
mse(goldStandard, estimates)
```

Arguments

goldStandard Numeric vector estimates Numeric vector

Value

MSE(goldStandard, estimates)

Multitype

Create a multitype outcome object

Description

Multitype creates a multitype outcome object, usually used as a response variable in a hierarchical Cyclops model fit.

Usage

```
Multitype(y, type)
```

Arguments

y Numeric: Response count(s)
type Numeric or factor: Response type

Value

An object of class Multitype with length equal to the length of y and type.

```
Multitype(c(0,1,0), as.factor(c("A","A","B")))
```

18 predict.cyclopsFit

oxford

Oxford self-controlled case series data

Description

A dataset containing the MMR vaccination / meningitis in Oxford example from Farrington and Whitaker. There are 10 patients comprising 38 unique exposure intervals.

Usage

```
data(oxford)
```

Format

A data frame with 38 rows and 6 variables:

```
indiv patient identifierevent number of events in intervalinterval interval length in daysagegr age groupexgr exposure grouploginterval log interval length ...
```

Source

```
http://statistics.open.ac.uk/sccs/r.htm
```

```
predict.cyclops Fit \qquad \textit{Model predictions}
```

Description

predict.cyclopsFit computes model response-scale predictive values for all data rows

Usage

```
## S3 method for class cyclopsFit
predict(object, ...)
```

Arguments

```
object A Cyclops model fit object
... Additional arguments
```

print.cyclopsData 19

print.cyclopsData Print a Cyclops data object

Description

print.cyclopsData displays information about a Cyclops data model object.

Usage

```
## S3 method for class cyclopsData
print(x, show.call = TRUE, ...)
```

Arguments

x A Cyclops data model object

show.call Logical: display last call to construct the Cyclops data model object

... Additional arguments

Description

print.cyclopsFit displays information about a Cyclops model fit object

Usage

```
## S3 method for class cyclopsFit
print(x, show.call = TRUE, ...)
```

Arguments

x A Cyclops model fit object

show.call Logical: display last call to update the Cyclops model fit object

... Additional arguments

20 readCyclopsData

Description

readCyclopsData reads a Cyclops-formatted text file.

Usage

```
readCyclopsData(fileName, modelType)
```

Arguments

fileName Name of text file to be read. If fileName does not contain an absolute path, the

name is relative to the current working directory, getwd.

modelType character string: Valid types are listed below.

Details

This function reads a Cyclops-formatted text file and returns a Cyclops data object. The first line of the file may start with '#", indicating that it contains header options. Valid header options are:

row_label	(assume file contains a numeric column of unique row identifiers)
stratum_label	(assume file contains a numeric column of stratum identifiers)
weight	(assume file contains a column of row-specific model weights, currently unused)
offset	(assume file contains a dense column of linear predictor offsets)
bbr_outcome	(assume logistic outcomes are encoded -1/+1 following BBR)
log_offset	(assume file contains a dense column of values x_i for which $log(x_i)$ is the offset)
add_intercept	(automatically include an intercept column of all 1s for each entry)
indicator_only	(assume all covariates 0/1-valued and only covariate name is given)
sparse	(force all BBR formatted covariates to be represented as sparse, instead of
	sparse-indicator, columns really only for debugging)
dense	(force all BBR formatted covariates to be represented as dense columns really
	only for debugging)

Successive lines of the file are white-space delimited and follow the format:

[Row ID] {Stratum ID} [Weight] <Outcome> {Censored} {Offset} <BBR covariates>

- [optional]
- <required>
- {required or optional depending on model}

Bayesian binary regression (BBR) covariates are white-space delimited and generally in a sparse '<name>:<value>' format, where 'name' must (currently) be numeric and 'value' is non-zero. If option 'indicator_only' is specified, then format is simply '<name>'. 'Row ID' and 'Stratum ID' must be numeric, and rows must be sorted such that equal 'Stratum ID' are consecutive. 'Stratum ID' is required for 'clr' and 'sccs' models. 'Censored' is required for a 'cox' model. 'Offset' is (currently) required for a 'sccs' model.

simulateCyclopsData 21

Value

A list that contains a Cyclops model data object pointer and an operation duration

Models

Currently supported model types are:

"ls" Least squares

"pr" Poisson regression

"lr" Logistic regression

"clr" Conditional logistic regression

"cpr" Conditional Poisson regression

"sccs" Self-controlled case series

"cox" Cox proportional hazards regression

Examples

Description

simulateCyclopsData generates a simulated large, sparse data set for use by fitCyclopsSimulation.

Usage

```
simulateCyclopsData(nstrata = 200, nrows = 10000, ncovars = 20,
  effectSizeSd = 1, zeroEffectSizeProp = 0.9, eCovarsPerRow = ncovars/100,
  model = "survival")
```

Arguments

nstrata Numeric: Number of strata

nrows Numeric: Number of observation rows

ncovars Numeric: Number of covariates

effectSizeSd Numeric: Standard derivation of the non-zero simulated regression coefficients

zeroEffectSizeProp

Numeric: Expected proportion of zero effect size

eCovarsPerRow Number: Effective number of non-zero covariates per data row

model String: Simulation model. Choices are: logistic, poisson or survival

Value

A simulated data set

Examples

```
#Generate some simulated data:
sim <- simulateCyclopsData(nstrata = 1, nrows = 1000, ncovars = 2, eCovarsPerRow = 0.5,</pre>
                            model = "poisson")
cyclopsData <- convertToCyclopsData(sim$outcomes, sim$covariates, modelType = "pr",</pre>
                                     addIntercept = TRUE)
#Define the prior and control objects to use cross-validation for finding the
#optimal hyperparameter:
prior <- createPrior("laplace", exclude = 0, useCrossValidation = TRUE)</pre>
control <- createControl(cvType = "auto", noiseLevel = "quiet")</pre>
fit <- fitCyclopsModel(cyclopsData,prior = prior, control = control)</pre>
#Find out what the optimal hyperparameter was:
getHyperParameter(fit)
#Extract the current log-likelihood, and coefficients
logLik(fit)
coef(fit)
#We can only retrieve the confidence interval for unregularized coefficients:
confint(fit, c(0))
```

summary.cyclopsData

Cyclops data object summary

Description

summary.cyclopsData summarizes the data held in an Cyclops data object.

Usage

```
## S3 method for class cyclopsData
summary(object, ...)
```

Arguments

object A Cyclops data object
... Additional arguments

Value

Returns a data. frame that reports simply summarize statistics for each covariate in a Cyclops data object.

vcov.cyclopsFit 23

vcov.cyclopsFit	Calculate variance-covariance matrix for a fitted Cyclops model object
-----------------	--

Description

vcov.cyclopsFit returns the variance-covariance matrix for all covariates of a Cyclops model object

Usage

```
## S3 method for class cyclopsFit
vcov(object, control, overrideNoRegularization = FALSE,
...)
```

Arguments

```
object A fitted Cyclops model object

control A Cyclops control object

overrideNoRegularization

Logical: Enable variance-covariance estimation for regularized parameters

... Additional argument(s) for methods
```

Value

A matrix of the estimates covariances between all covariate estimates.

Index

```
coef.cyclopsFit, 2
